### Operation

Pilot operated check valves type VP-NOV enable the hydraulic fluid flow in the service lines to be automatically shut off and made free, respectively. Free flow direction is always from the valve side "V" to the subplate side "P". In the opposite direction the valve is blocked for the hydraulic fluid flow. Free flow in port A in direction P to V is achieved by means of pressure in port B, and vice versa. To assure zero leakage there is necessary to discharge ports A and B towards T in the zero position of the directional valve.
