

4/3-, 4/2- and 3/2- directional valves

with switching time adjustment, Type 5-.WE 10

RE 23320/12.2004

Size 10

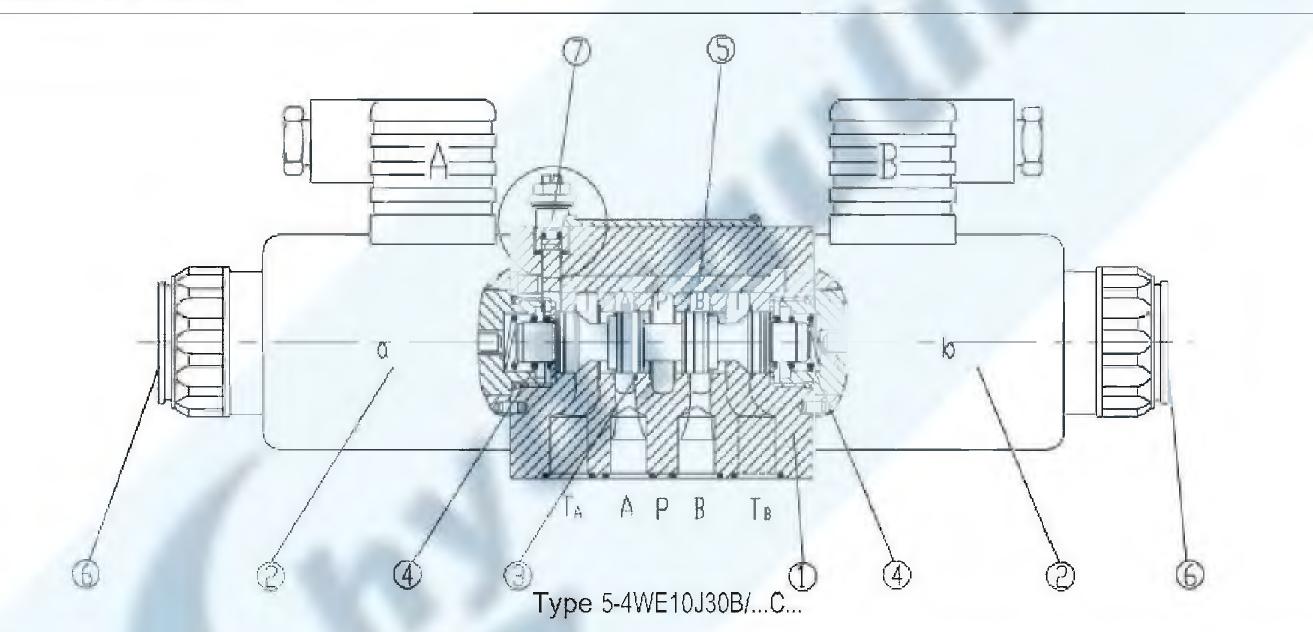

up to 31.5 MPa

up to 120 L/min

Features:

- Direct solenoid actuated directional spool valve
- Wet pin DC solendois with removable coil (AC voltages possible via a rectifier)
- Solenoid coil can be rotated through 90°
- The coil can be replaced without opening the pressure-tight chamber
- Individual electrical connections
- Hand override, optional
- -Adjustable spool switching time, optional
- -Porting pattern to Din 24 340 form A, ISO 4401 and CETOP-RP 121H

Function, section

5-chamber directional valves of type 5-.WE are solenoid operated directional spool valves. They control the start, stop and direction of flow with the additional option of adjusting the spool switching time. These directional valves basically consist of the housing (1), one or two solenoids (2), the control spool (3), as well as one or two return springs (4). The two spring chamber are connected by a connecting bore (5). As the spool switches, the flow is displaced from one spring chamber to the other via this passage. If the area of this connecting bore is reduced by an orifice, the switching time changes accordingly. The T channels are isolated from the spring chambers. This means that switching pulses do not affect the control spool (3) and thus, soft switching of the spool can be achieved. In the de-energized condition, the control spool (3) is held in the central or initial position by return springs (4) (except for impulse spools). The control spool (3) is actuated by wet pin solenoids (2).

In order to ensure correct functioning, care must be taken to ensure that the pressure chamber of the solenoid is filled with oil.

The force of the solenoid (2) acts on the control spool (3) and switches it from its rest position to the required end position. This then permits flow from P to A and B to T or P to B and A to T.When the solenoid (2) is deenergized the control spool (3) is returned to its rest position by the return spring (4).A hand override (6), optional, enables the control spool (3) to be moved without energization of the solenoids.

Adjustable spool switching time (only with DC solenoids) The optional installation of an orifice screw (7) or orifice (8) - see below - offers the possiblity of increasing switching time

- with orifice screws type 5-.WE 10 ../..CG../C..

- with throttle type 5-.WE 10 ../..CG../A..

- 1 -

Funtion, secion

With the installation of orifices, the spool switching time may be lengthened by more than 100 ms. The actual time is dependent upon the individual system (e.g. pressure, flow and viscosity). When reto-fitting or modifying a throttling system, care must be taken that the fluid volume in the spring chambers and the connecting bore (5) is retained, as this is a prerequisite for the smooth operation of the switching time adjustment.

Type 5-.WE 10.30/OC....

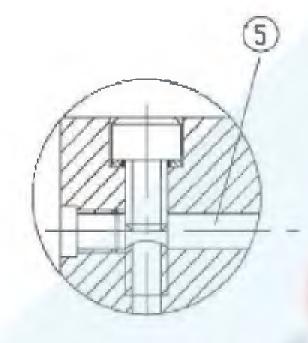

(only possible with symbols A, C and D)

This version is a directional valve with 2 switched positions and 2 solenoids without detent. There is no defined spool postiion in the deenergized condition.

Type 5-.WE 10.30/OFC... (impulse spool), with detent (only possible with symbols A, C and D)

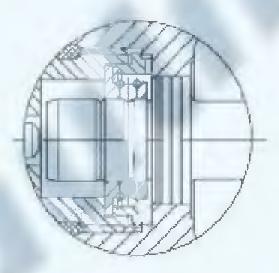

This version is a directional valve with 2 detented switched postions and 2 solenoids. Thus, the spool is held in the last switched position, permanent energisation of the solenoid is not required.

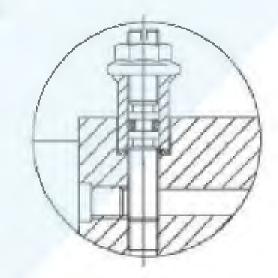

Throttle insert (type 5-.WE 10.30/.../B..) The use of a throttle insert is required if, due to the operating conditions, flows can occur during the switching process which are larger than the perfomance limits of the valve allow.

Without spool throttle

with orifice

With detent

With throttle screw (without throttle bore)

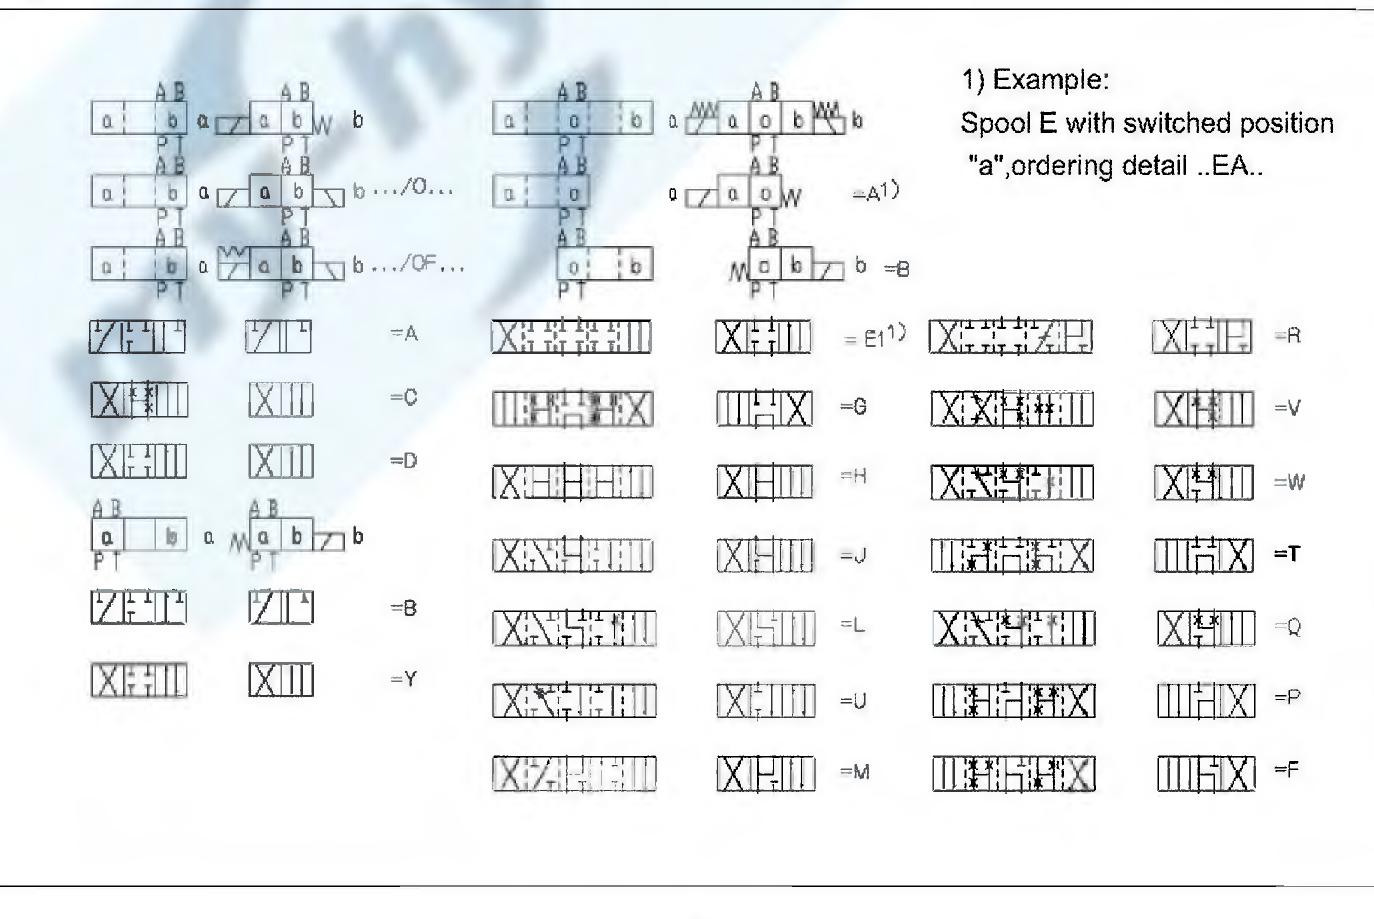

The orifice is to be inserted into the

P channel of the directional valve.

1) special voltages on request

When connecting the electrics, the protective conductor (PE =) must be connected according to the relevant regulations.

Note,		W42	42V. 50Hz		W230	230V, 50Hz
These solenoids may be used for 2 types of supply:			42V, 60Hz	Type		230V, 60Hz
e.g. solenoid type W110 for:	ler T	W110	110V 50Hz 120V 60Hz	rder ⁻	W220	220V, 50Hz
110V, 50Hz	Ord		110V 60Hz	Ő		220V, 60Hz
120V, 60Hz						

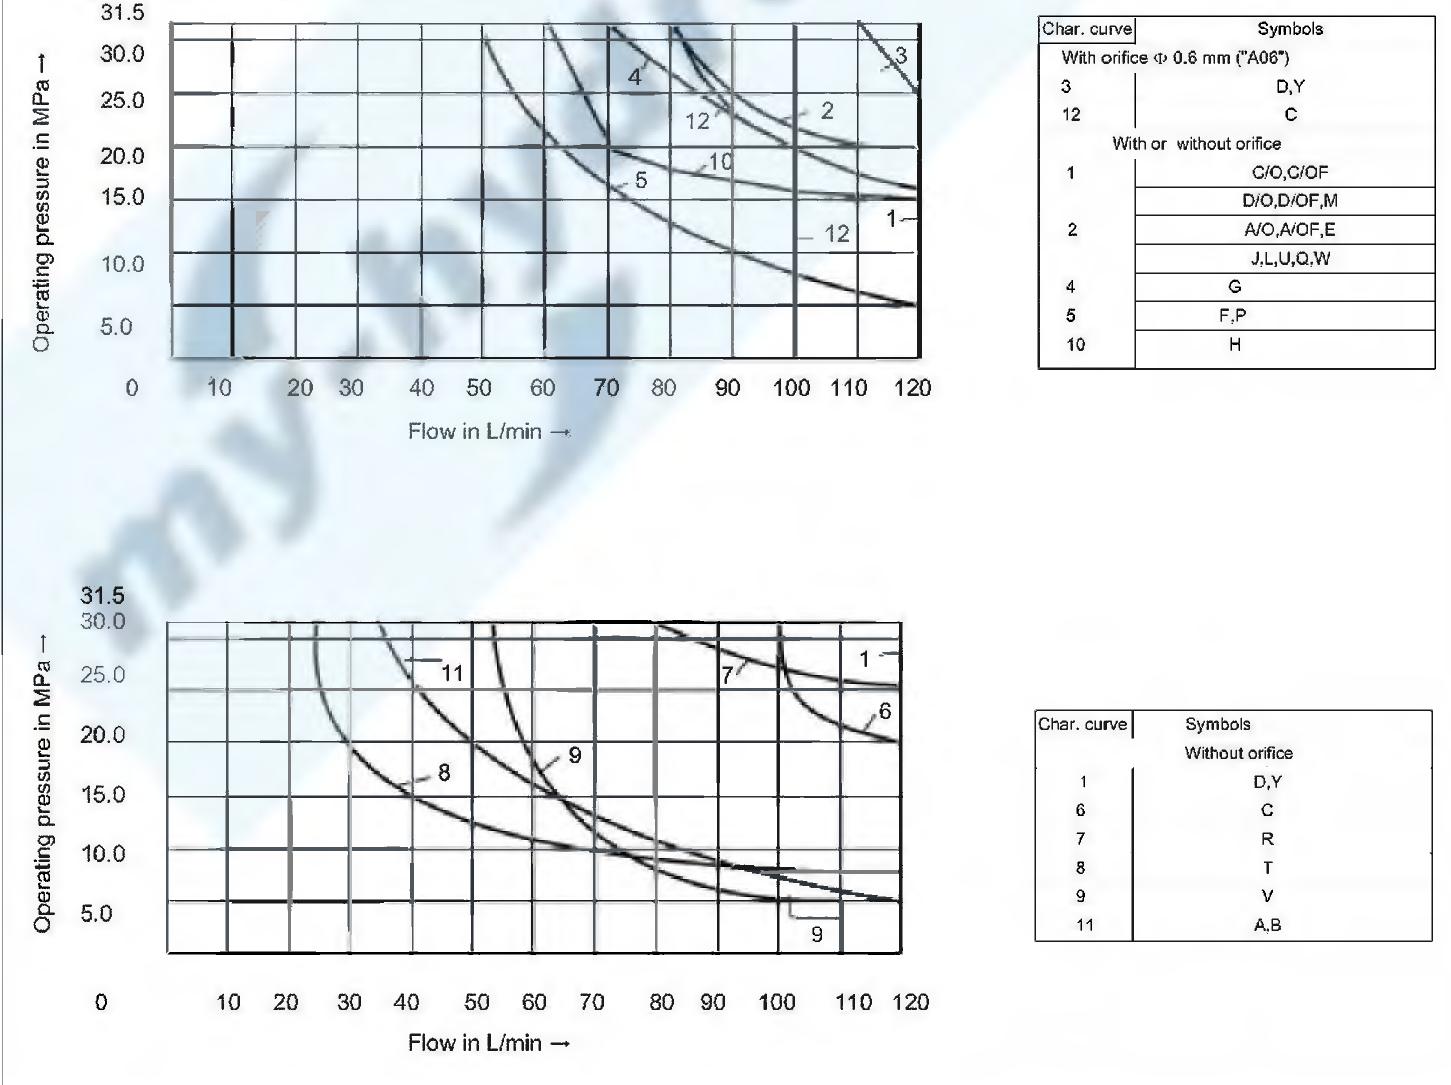

Performance limits: (measured at $v = 41 \text{ mm}^2/\text{s}$ and $t = 50 \degree\text{C}$)

The performance limits shown are valid when the valve is used with two directions of flow (e.g. from P to A with simultaneous return flow from B to T).

Due to the flow forces occurring within the valves, the permissible switching performance limits can be significantly lower with only one direction of

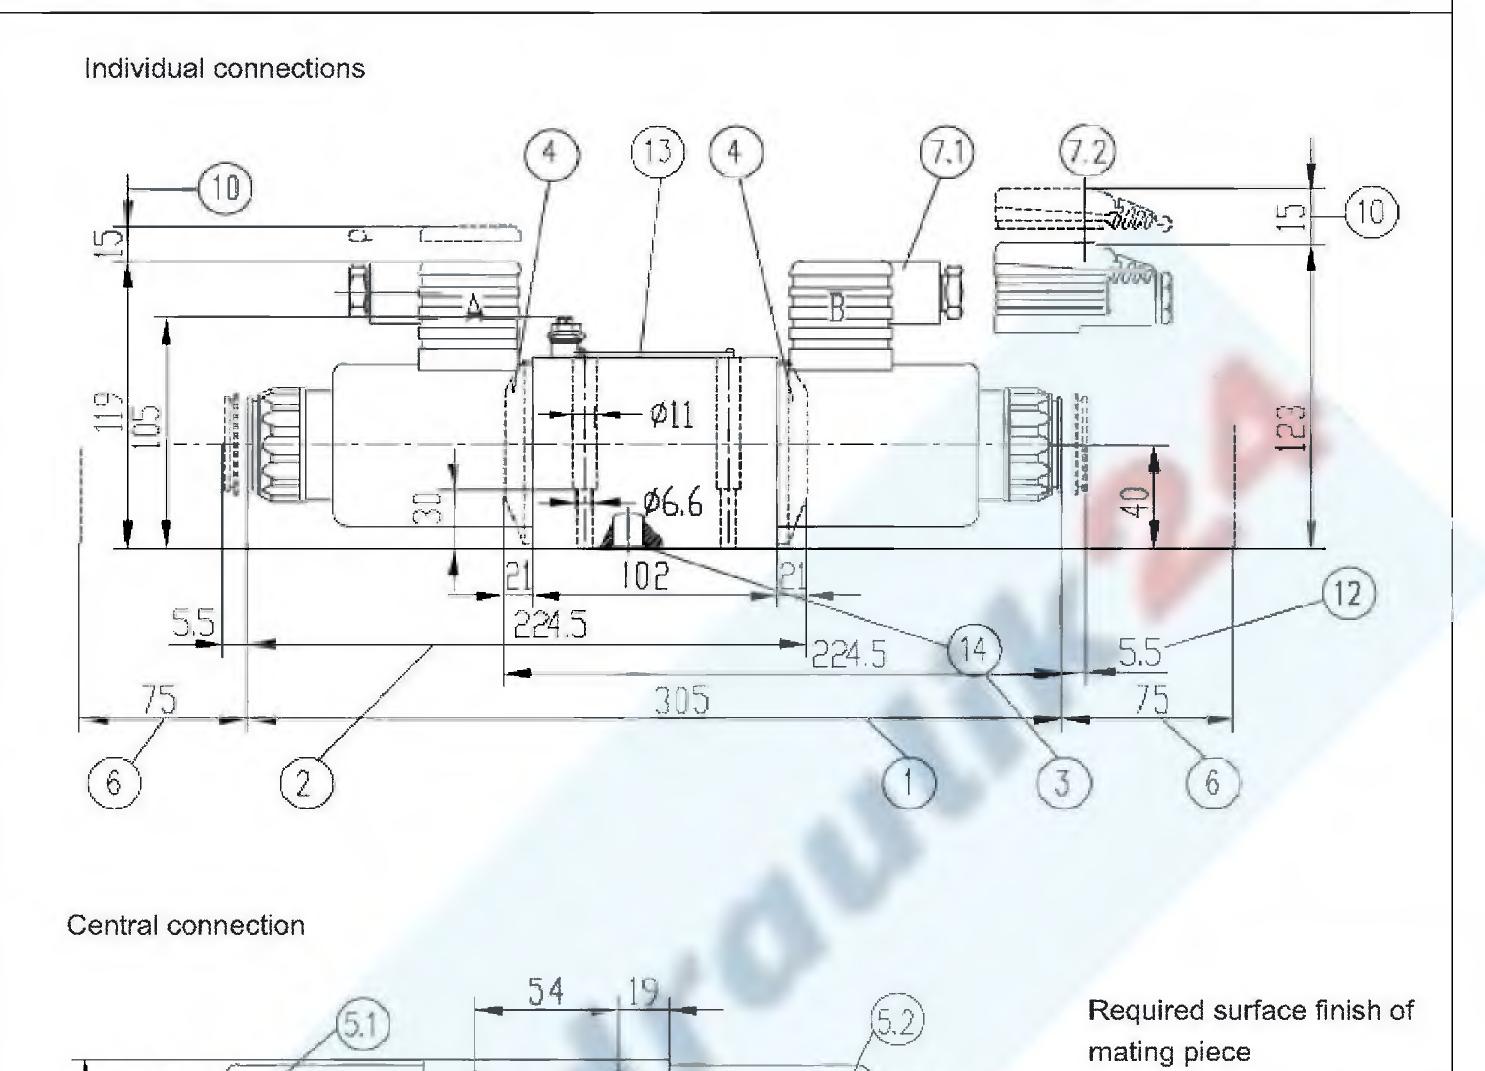

flow (e.g. from P to A and with port B blocked)! (For these applications, please consult us.)

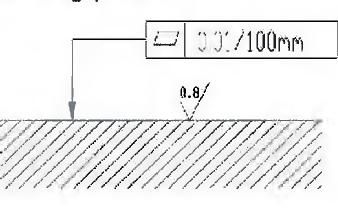

The performance limits were determined with the solenoid at operating temperature, 10 % under voltage and with no preloading of the tank.

Unit dimensions

(Dimensions in mm)

1 3-Position valve

2 2-Position valve

With 1solenoid (A, C, D, EA...)

3 2-Position valve

With 1solenoid (B, Y, EB...)

must be ordered separately (see page 206)

Notice

- 1. The fluid must be filtered. Minimum filter fineness is 20 μ m.
- 2. The tank must be sealing up and an air filter must be installed on air entrance.
- 3. Products without subplate when leaving factory, if need them, please ordering specially.
- 4. Valve fixing screws must be high intensity level (class 10.9). Please select and use them according to the parameter listed in the sample book.
- 5. Roughness of surface linked with the valve is required to $\frac{0.8}{2}$.
- 6. Surface finish of mating piece is required to 0.01/100mm.
